Vision

I am an expert in inventing and applying technologies to enable the systematic mapping, analysis, and repair of the brain and other complex biological systems. My MIT group's philosophy is to try to bring the observation and fixing of such complex systems to a "ground truth" level, addressing the fundamental mechanisms of operation of these systems in a scalable and systematic way. We are developing tools that enable molecular mapping of cells and tissues with nanoscale precision (expansion microscopy), recording of the high-speed dynamics of brain circuits and other biological systems (voltage indicators and other fluorescent indicators evolved by robotic directed evolution, as well as spatially and temporally multiplexed reporters), and control of the activity of brain cells using molecular tools engaged by light (optogenetics). I am a neuroscientist and physicist, and skilled at many domains of engineering, ranging from nanoengineering to chemistry to genomics to optics to electrical engineering, thanks to my interdisciplinary training in many fields. I lead an extremely multidisciplinary team to tackle these problems, including physicists, chemists, computer scientists, clinicians, and hardware engineers. We apply these tools, in-house, to the analysis of small nervous systems such as those of C. elegans and the larval zebrafish (with the goal of ultimately simulating entire brains in a biologically realistic manner), and also work on the fundamental understanding and confrontation of brain aging, as well as neurological and psychiatric conditions. I collaborate with many dozens of labs around the world to bring new technologies to fruition, and to apply these tools to solve basic and applied scientific problems. Our lab at MIT, and our partners, have distributed our tools to thousands of researchers around the world.

Classes Taught

Applications of Neuroengineering, MAS.882/9.433, MIT (Spring 2008, Spring 2009)
Project-focused course in which students take top-down approach to developing technologies that address critical clinical and basic-science problems of human brain function. Focus is on application of engineering principles to development of systematically powerful tools. Problem domains include neurological/psychiatric disorders, consciousness, and human cognitive augmentation. Students work in teams to apply cross-disciplinary (e.g., molecular, physical, nanotechnological) building blocks to design new tools for the analysis and engineering of the brain.

Bioinstrumentation Project Lab, 20.345, MIT (Spring 2011, Spring 2012, Spring 2013, Spring 2014, Spring 2015, Spring 2016, Spring 2018)
In-depth examination of instrumentation design, principles and techniques for studying biological systems, from single molecules to entire organisms. Lectures cover optics, advanced microscopy techniques, electronics for biological measurement, magnetic resonance imaging, computed tomography, MEMs, microfluidic devices, and limits of detection. Students select two lab exercises during the first half of the semester and complete a final design project in the second half. Lab emphasizes design process and skillful realization of a robust system. (Taught in collaboration with M. F. Yanik, S. Nagle, P. So, S. Wasserman, M. Jonas, E. Frank, and others.)

Biological Instrumentation and Measurement, 20.309, MIT (Spring 2009, Spring 2010, Spring 2014, Spring 2015, Spring 2016, Spring 2017, Spring 2018, Spring 2019, Spring 2020, Spring 2021, Spring 2022, Spring 2023)
Sensing and measurement aimed at quantitative molecular/cell/tissue analysis in terms of genetic, biochemical, and biophysical properties. Methods include light and fluorescence microscopies, and electro-mechanical probes (atomic force microscopy, optical traps, MEMS devices). Application of statistics, probability, signal and noise analysis, and Fourier techniques to experimental data. Enrollment limited; preference to Course 20 undergraduates. (Taught in collaboration with M. F. Yanik, S. Nagle, P. So, S. Wasserman, M. Jonas, E. Frank, A. Hansen, and others, over the years.)

Neurotechnology Ventures, MAS.883/9.455/20.454/15.128 (MAS.961/9.912J/HST.588 in Spring 2007; MAS.883/9.455/20.454/15.128/HST.588 Fall 2008-Fall 2009), MIT (Spring 2007, Fall 2008, Fall 2009, Fall 2010, Fall 2011, Fall 2012, Fall 2013, Fall 2014)
A special seminar focused on the challenges of envisioning, planning and building startups; commercializing innovations from neuroscience; and the blossoming domain of neuroengineering. (Taught in collaboration with J. Bonsen and R. Ellis-Behnke.)

Principles of Neuroengineering, MAS.881/9.422/20.352 (starting Fall 2017)/20.452, MIT (Fall 2007, Fall 2008, Fall 2009, Fall 2010, Fall 2011, Fall 2012, Fall 2013, Fall 2014, Fall 2015, Fall 2017, Fall 2018, Fall 2019, Fall 2020, Fall 2021, Fall 2022)
Covers principles underlying current and future technologies for brain analysis and engineering, for neurology, psychiatry, and neuroscience. Focuses on using biophysical, biochemical, and anatomical models to understand technology design constraints governing ability to observe and alter brain function. Topics include functional magnetic resonance imaging, electromagnetic recording/stimulation, neuropharmacology, optical cellular imaging, and gene/stem-cell therapy. Design projects by student teams.

Revolutionary Ventures, MAS.883/9.455/20.454/15.128, MIT (Fall 2015, Fall 2017, Fall 2018, Fall 2019, Fall 2020, Fall 2021, Fall 2022)
Seminar on envisioning and building ideas and organizations to accelerate engineering revolutions. Focuses on emerging technology domains, such as neurotechnology, imaging, cryotechnology, gerontechnology, and bio-and-nano fabrication. Draws on historical examples as well as live case studies of existing or emerging organizations, including labs, institutes, startups, and companies. Goals range from accelerating basic science to developing transformative products or therapeutics. Each class is devoted to a specific area, often with invited speakers, exploring issues from the deeply technical through the strategic. Individually or in small groups, students prototype new ventures aimed at inventing and deploying revolutionary technologies. (Taught in collaboration with, over the years, J. Bonsen, J. Weis, D.
